

Press Release: For Immediate Release

American Broadband, a Nebraska communications company, will be bringing new and enhanced Fiber Optic and Ethernet Transport technologies to portions of the Fremont business sector within the next 30 days. Fiber-Ethernet is a high-bandwidth, data transport service that provides quality high-speed Internet connections without all of the modems and filters. Additionally, this service allows local businesses to connect two or more office locations for data transmissions.

Mitchell Sick, IT Manager for American Broadband stated that there is a growing demand by businesses in rural communities for higher bandwidth. "As broadband becomes the backbone for main stream communications, the need for this type of technology will continue to increase."

American Broadband was approached by Pat Langan, Executive Director for Greater Fremont Development Council, approximately six months ago to see if American Broadband had an interest in providing fiber optic technology to the community. In order to secure economic growth, it was imperative that affordable options were available to the business sector, stated Pat.

"We're extremely excited to be able to provide leading edge technologies to such a progressive community as Fremont," stated Shawn Hanson, General Manager of American Broadband." "It just makes sense for us to come into Fremont given the fact that we serve the western part of rural Washington County, which is adjacent to Fremont and Dodge County."

Jeremy Barton, IT Director for Fremont's Paragon Computer Solutions stated that Fremont currently has limited options for Internet bandwidth and business to business connectivity that are reasonably priced. "Based on the comparisons that I've seen between companies who support these services, American Broadbands' options are better, faster, and the most economical. I'm very excited that American Broadband will provide Internet services and transport service options for all business types, stated Jeremy." In addition to owning his own computer solutions business, Jeremy is part of the Fremont Technology Group.

Along with Fiber-Ethernet, American Broadband will also provide scalable Ethernet solutions for those businesses simply wanting more bandwidth. Within the next year, American Broadband will also provide telephone, and traditional high speed Internet access services to the area as well.

American Broadband currently has representatives canvassing the business community providing information regarding these new services. Several businesses have already signed up to services and are awaiting the construction to their doors. Jay Anderson, head of the American Broadband sales team, warns people not to sign contracts until they've explored all options available. "There are some technologies that are being deployed that are not as favorable as others. Additionally, the price range when comparing companies is very broad."

For more information regarding American Broadband services or when these services will be available in your area, contact Jay Anderson at 402-426-6227 or 402- 669-5614
